

# Entity Relationship Modelling

P.J. McBrien

Imperial College London

# Maintaining a Relational Database Schema

## Designing a relational database schema

- 1 Describe the semantics of the UoD as a conceptual schema
  - ER (many variants exist)
  - UML class diagrams
- 2 Need to map the ER/UML schema into a relational schema: normalisation

## Maintaining a relational database schema

- 1 Want the semantics of the UoD as a conceptual schema
  - updates to schema
  - schema integration
- 2 If lost/never created, then need to reverse engineer the conceptual schema

# Semantic Modelling: ER Schemas

```

CREATE TABLE branch
(
    sortcode INTEGER NOT NULL,
    bname VARCHAR(20) NOT NULL,
    cash DECIMAL(10,2) NOT NULL,
    CONSTRAINT branch_pk PRIMARY KEY (sortcode)
)

CREATE TABLE account
(
    no INTEGER NOT NULL,
    type CHAR(8) NOT NULL,
    cname VARCHAR(20) NOT NULL,
    rate DECIMAL(4,2) NULL,
    sortcode INTEGER NOT NULL,
    CONSTRAINT account_pk PRIMARY KEY (no),
    CONSTRAINT account_fk FOREIGN KEY (sortcode) REFERENCES branch
)

CREATE INDEX account_type ON account (type)

CREATE TABLE movement
(
    mid INTEGER NOT NULL,
    no INTEGER NOT NULL,
    amount DECIMAL(10,2) NOT NULL,
    tdate DATETIME NOT NULL,
    CONSTRAINT movement_pk PRIMARY KEY (mid),
    CONSTRAINT movement_fk FOREIGN KEY (no) REFERENCES account
)
  
```

# Core $\mathcal{ER}$ : Entities and Relationships

## Entities

**E** An entity  $E$  represents a set of objects which conceptually are the same type of thing

- **nouns**  $\rightarrow$  entity set
- proper nouns imply instances, which are not entity sets.

## Relationships

**R** A relationship  $R$  represents a set of tuples of objects where each tuple is some type of conceptual association between entities  $E_1, E_2$

- **verbs**  $\rightarrow$  relationship
- $R \subseteq \{\langle e_1, e_2 \rangle \mid e_1 \in E_1 \wedge e_2 \in E_2\}$

## Identifying entities and relationships

*In News Ltd, each person works in exactly one department; there are no restrictions on the number of persons a department may employ.*

Core  $\mathcal{ER}^{\mathcal{KMO}}$ : Attributes of EntitiesAttributes  $\mathcal{ER}^{\mathcal{M}}$   $\mathcal{ER}^{\mathcal{O}}$  and  $\mathcal{ER}^{\mathcal{K}}$ 

✓ A mandatory attribute  $E.A$  is a function that maps from entity set  $E$  to value set  $V$ .

- 1  $E.A \subseteq \{\langle e, v \rangle \mid e \in E \wedge v \in V\}$
- 2 unique:  $\langle e, v_1 \rangle \in E.A \wedge \langle e, v_2 \rangle \in E.A \rightarrow v_1 = v_2$
- 3 mandatory:  $E = \{e \mid \langle e, v \rangle \in E.A\}$

**adjective, adjective noun**  $\rightarrow$  attribute

○ an **optional attribute** removes property (3)

⌘ certain attribute(s)  $E.A_1 \dots E.A_n$  of  $E$  are denoted **key attributes** such that  $E = \{\langle v_1, \dots, v_n \rangle \mid \langle e, v \rangle \in E.A_1 \wedge \dots \wedge \langle e, v_n \rangle \in E.A_n\}$

## Identifying attributes

*We record the name of each person working in the department; and identify them by their salary number. Optionally they might have a bonus figure recorded.  
Departments are identified by their name.*

# $\mathcal{ER}^{\mathcal{L}}$ : Look-Here Cardinality Constraints

 $\mathcal{ER}^{\mathcal{L}}$ 

- An upper bound cardinality constraint  $U$  states that each instance of  $E_1$  may appear at most  $U$  times in  $R$ . An upper bound of  $N$  indicates no limit.
- Additionally with  $\mathcal{ER}^{\mathcal{O}}$ : a lower bound cardinality constraint  $L$  states that each instance of  $E_1$  must appear at least  $L$  times in  $R$

## Adding look-here cardinality constraints in $\mathcal{ER}^{\mathcal{LO}}$

*Each person works in exactly one department; there are no restrictions on the number of persons a department may employ.*

# Quiz 1: Extent of Relationships

person = {'Peter', 'Jane', 'Mary'}

dept = {'CS', 'Maths'}

Which is not a possible extent of works\_in?

A

works\_in = {⟨'Peter', 'Maths'⟩, ⟨'Peter', 'CS'⟩, ⟨'Mary', 'Maths'⟩, ⟨'Jane', 'Maths'⟩}

B

works\_in = {⟨'Peter', 'Maths'⟩, ⟨'Mary', 'Maths'⟩, ⟨'Jane', 'Maths'⟩}

C

works\_in = {⟨'Peter', 'CS'⟩, ⟨'Mary', 'Maths'⟩, ⟨'Jane', 'Maths'⟩}

D

works\_in = {⟨'Peter', 'CS'⟩, ⟨'Jane', 'Maths'⟩}

## Quiz 2: Cardinality Constraints on Relationships

*Branches based in towns are all assigned to an area manager for that town; and area managers are only assigned to towns that have branches*

What should be the cardinality constraints of in?

A

$x = 1:1, y = 0:N$

B

$x = 0:1, y = 0:N$

C

$x = 0:N, y = 1:N$

D

$x = 0:1, y = 1:N$

# ER<sup>C</sup>: Look-Across Cardinality Constraints

- This course uses **look-here** cardinality constraints: state the number of occurrences of the entity next to the constraint

- Other variants of ER modelling use **look-across** cardinality constraints

- For binary relationships, ER<sup>C</sup> and ER<sup>L</sup> are equally expressive.

# $\mathcal{ER}^S$ : Subset/isa hierarchies

## $\mathcal{ER}^S$

**S**: if it is found that the instances of one entity  $E_s$  are a subset of a another entity  $E$ , we may add a **subset** constraint.

$$E_s \subseteq E$$

- **specialisation of nouns** → subset

## Identifying subsets with $\mathcal{ER}^S$

*Some employees are ranked as managers, and receive a mobile phone.*

## Quiz 3: Extent of subset and superset entities

manager = {'Jane', 'Mary'}

Which is not a possible extent of person and engineer?

A

person = {'Peter', 'Jane', 'Mary'}  
engineer = {'Jane', 'Mary'}

B

person = {'Peter', 'Jane', 'Mary', 'John'}  
engineer = {}

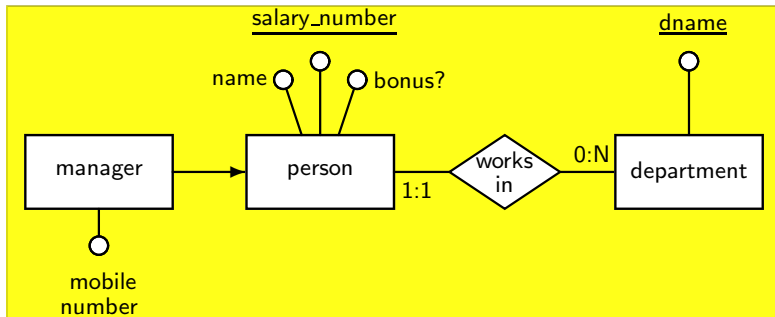

C

person = {'Peter', 'Jane', 'Mary'}  
engineer = {'John'}

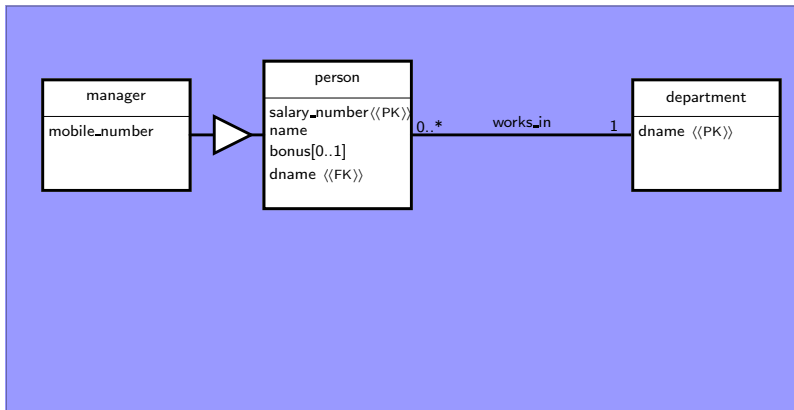

D

person = {'Peter', 'Jane', 'Mary', 'John'}  
engineer = {'Peter', 'John'}

# Combining Fragments

# Using UML Class Diagrams as ER Models

## How to Use UML Class Diagrams as an ER Schema

Use UML stereotypes to denote at least primary key information

*Various approaches exist*

# ER Modelling Constructs $\mathcal{CKLMOS}$

Construct	Description
$\mathcal{C}$	Look-across cardinality constraints
$\mathcal{L}$	Look-here cardinality constraints
$\mathcal{K}$	Key attributes
$\mathcal{M}$	Mandatory attributes
$\mathcal{O}$	Optional attributes
$\mathcal{S}$	Isa hierarchy between entities

*You normally choose between  $\mathcal{C}$  or  $\mathcal{L}$*

## Worksheet: ER Modelling

Draw an  $\mathcal{ER}^{KLMOS}$  schema to describe the following domain

*The payroll system for BIG Inc records the salaries, status, joining date, name, and payroll number for all of the corporation's 30,000 employees. Each employee works for one division, and each division has an account number for paying its staff. We identify divisions by their name, and record the address where the division's HQ is located.*

*For employees sent abroad by BIG Inc, we record the address, country and telephone number of the foreign tax office that will handle the employee. It is assumed that each country has one central tax office that we have to deal with. All other employees have their tax affairs dealt with by the Inland Revenue.*

# Worksheet: ER Modelling

Draw an  $\mathcal{ER}^{KLMOS}$  schema to describe the following domain

*The payroll system for BIG Inc records the salaries, status, joining date, name, and payroll number for all of the corporation's 30,000 employees. Each employee works for one division, and each division has an account number for paying its staff. We identify divisions by their name, and record the address where the division's HQ is located.*

*For employees sent abroad by BIG Inc, we record the address, country and telephone number of the foreign tax office that will handle the employee. It is assumed that each country has one central tax office that we have to deal with. All other employees have their tax affairs dealt with by the Inland Revenue.*

# Mapping $\mathcal{ER}^{KLMOS}$ to a relational model: entities and attributes

Taking a **table per type (TPT)** approach, there is a simple mapping of entities and attributes to tables and columns:

- 1 Each entity  $E$  maps to a table  $R_E$
- 2 Each attribute  $A$  maps to a column  $C_A$  of  $R_E$
- 3 If  $A$  is an optional attribute, then  $C_A$  is nullable, otherwise  $C_A$  is not nullable
- 4 If  $\vec{K}$  are key attribute(s), then  $\vec{C}_K$  are a key of  $R_E$

## Tables generated from entities

person(salary\_number,name,bonus?)  
 department(dname)

## Mapping $\mathcal{ER}^{\mathcal{KLMOS}}$ to a relational model: relationships

Taking a **table per type (TPT)** approach, for each relationship  $R$  between  $E_1, E_2$ , entities  $E_1, E_2$  map to  $R_1, R_2$  as before, and

1 If  $R$  is a many-many relationship then it maps to

1 a table  $R\_R_1\_R_2(\vec{K}_1, \vec{K}_2)$

2 a foreign key  $R\_R_1\_R_2(\vec{K}_1) \xRightarrow{fk} R_1(\vec{K}_1)$

3 a foreign key  $R\_R_1\_R_2(\vec{K}_2) \xRightarrow{fk} R_2(\vec{K}_2)$

2 If  $R$  is a one-many relationship then it maps to

1 a column  $\vec{K}_2$  in  $R_1$

2 a foreign key  $R_1(\vec{K}_2) \xRightarrow{fk} R_2(\vec{K}_2)$

3 if the participation of  $E_1$  in  $R$  is optional, then  $\vec{K}_2$  is an optional column of  $R_1$

### Tables generated from relationships

```

person(salary_number, name, bonus?, dname)
department(dname)
person(dname)  $\xRightarrow{fk}$  department(dname)
  
```

# Mapping $\mathcal{ER}^{KLMOS}$ to a relational model: relationships

Taking a **table per type (TPT)** approach, for each relationship  $R$  between  $E_1, E_2$ , entities  $E_1, E_2$  map to  $R_1, R_2$  as before, and

1 If  $R$  is a many-many relationship then it maps to

- 1 a table  $R\_R_1\_R_2(\vec{K}_1, \vec{K}_2)$
- 2 a foreign key  $R\_R_1\_R_2(\vec{K}_1) \xrightarrow{fk} R_1(\vec{K}_1)$
- 3 a foreign key  $R\_R_1\_R_2(\vec{K}_2) \xrightarrow{fk} R_2(\vec{K}_2)$

2 If  $R$  is a one-many relationship then it maps to

- 1 a column  $\vec{K}_2$  in  $R_1$
- 2 a foreign key  $R_1(\vec{K}_2) \xrightarrow{fk} R_2(\vec{K}_2)$
- 3 if the participation of  $E_1$  in  $R$  is optional, then  $\vec{K}_2$  is an optional column of  $R_1$

## Tables generated from relationships

person(salary\_number, name, bonus?)  
 department(dname)

works\_in(salary\_number, dname)  
 works\_in(salary\_number)

$\xrightarrow{fk}$  person(salary\_number)

works\_in(dname)  $\xrightarrow{fk}$  department(dname)

# Mapping $\mathcal{ER}^{KLMOS}$ to a relational model: subsets

Taking a **table per type (TPT)** approach, for each subset  $E_s$  of  $E$ , entities  $E_s, E$  map to tables  $R_s, R$  as before and:

- 1 a key  $\vec{K}$  in  $R_s$  (where  $\vec{K}$  is the key of  $R$ )
- 2 a foreign key  $R_s(\vec{K}) \xRightarrow{f^k} R(\vec{K})$

## Tables generated from subsets

```

person(salary_number, name, bonus?)
manager(salary_number, mobile_phone)
manager(salary_number)  $\xRightarrow{f^k}$ 
    person(salary_number)
  
```

## Worksheet: Mapping $\mathcal{ER}^{\mathcal{KLMOS}}$ to a relational model

*Take your  $\mathcal{ER}^{\mathcal{KLMOS}}$  schema in the worksheet, and map it into a relational schema.*

# Relational $\leftrightarrow$ ER

## ER to relational mappings

- Design ER model for new DBMS system
- Map ER model to relations for DBMS implementation

## Relational to ER mappings

- Have existing DBMS that one wishes to view the design of
- Map relations to ER model for design review, modification and integration

# Mapping Relational to $\mathcal{ER}^{\mathcal{KLMOS}}$ : (Assuming TPT)

**R** If table  $R$  has just primary keys  $P_R$  that contains two columns which are foreign keys for  $R_1, R_2 \rightarrow$  many-many ER relationship  $R$  between entities for  $R_1, R_2$

**E** Otherwise  $R \rightarrow$  ER entity

For each column  $A$ :

**1** If  $A$  is (part of) a candidate key:

**S** if candidate key is also a foreign key  $\rightarrow$  subset

**K** otherwise  $A \rightarrow$  ER key attribute

**2** If  $A$  is not (part of) a candidate key:

**R** if  $A$  is (part of) a foreign key  $\rightarrow$  ER relationship

**O** otherwise if  $A$  is nullable  $\rightarrow$  ER optional attribute

**M** otherwise  $A \rightarrow$  ER mandatory attribute

Mapping Relational to  $\mathcal{ER}^{\mathcal{KLMOS}}$  using TPT: Example

site(sitecode,sortcode?,name)

withdraw(sitecode,cname)

customer(cname,joined,salary?,address,phone)

web\_customer(cname,username,password,email)

account(number,acname,cname,sitecode)

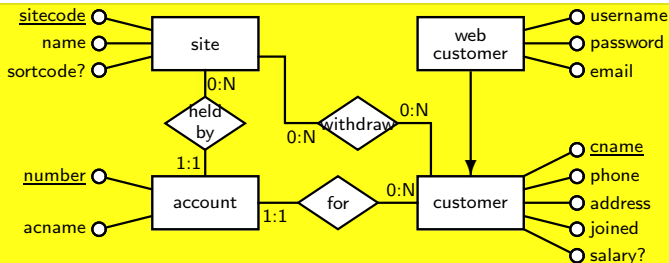

withdraw(sitecode)  $\xrightarrow{fk}$  site(sitecode)

withdraw(cname)  $\xrightarrow{fk}$  customer(cname)

web\_customer(cname)  $\xrightarrow{fk}$  customer(cname)

account(cname)  $\xrightarrow{fk}$  customer(cname)

account(sitecode)  $\xrightarrow{fk}$  site(sitecode)

# Worksheet: Reverse Engineering ER Schemas

Build an  $\mathcal{ER}^{KLMOS}$  schema representing the following relational schema

person(name,dcode,salary,age?)

person(dcode)  $\xRightarrow{fk}$  department(dcode)

manager(name,dcode,car)

manager(name)  $\xRightarrow{fk}$  person(name)

department(dcode,site)

sales\_department(dcode,telephone)

sales\_department(dcode)  $\xRightarrow{fk}$  department(dcode)

production\_department(dcode)

production\_department(dcode)  $\xRightarrow{fk}$  department(dcode)

department\_handles\_product(dcode,pcode)

department\_handles\_product(dcode)  $\xRightarrow{fk}$  department(dcode)

department\_handles\_product(pcode)  $\xRightarrow{fk}$  product(pcode)

product(pcode,price,weight)

## $\mathcal{ER}^D$ : Disjointness and Generalisation Hierarchies

- In  $\mathcal{ER}^D$ : the disjointness of entities  $E_1 \dots E_n$  may be specified, enforcing that  $\forall x, y. x \neq y \rightarrow E_x \cap E_y = \emptyset$
- The notion of **generalisation hierarchies** combines the use of disjointness and subset.
- **disjoint specialisation of nouns**  $\rightarrow$  generalisation

### Identifying generalisation hierarchies in $\mathcal{ER}^{SD}$

*Employees may also be divided, according to how they like to receive messages, into email users and non-email users. The former must have a email address recorded, the later must have a pigeon hole number recorded.*

## Quiz 4: Extent of generalisation entities

Which is not a possible extent the entities?

A

person = { 'Peter', 'Jane', 'Mary', 'John' }  
 engineer = { 'Peter', 'John' }  
 manager = { 'Jane', 'Mary' }

B

person = { 'Peter', 'Jane', 'Mary', 'John' }  
 engineer = { }  
 manager = { 'Jane', 'Mary' }

C

person = { 'Peter', 'Jane', 'Mary', 'John' }  
 engineer = { 'John' }  
 manager = { 'Jane', 'Mary' }

D

person = { 'Peter', 'Jane', 'Mary', 'John' }  
 engineer = { 'Peter', 'John', 'Mary' }  
 manager = { 'Jane', 'Mary' }

$\mathcal{ER}^w$ : Weak entities

- If we allow the participation of an entity in a relationship to be part of the entity key, we have a **weak entity**

## Quiz 5: Subsets and weak entities

Which of the following is equivalent to the schema above?

## $\mathcal{ER}^H$ : Allowing an $n$ -ary relationship

- In graph theory, an edge connecting more than two nodes is called a **hyper-edge**.
- In  $\mathcal{ER}^H$ : allow  $n$ -ary relationships between entities, rather than just binary
- An  $n$ -ary relationship is equivalent to a weak entity with  $n$  binary relationships

### Identifying an $n$ -ary relationship

*A person may work in multiple departments, and for each department the person works in, the person will be assigned a manager*

## $\mathcal{ER}^A$ : Allowing attributes on relationships

- Use when there are values to be associated with the relationship between entities

### Identifying an attribute of a relationship

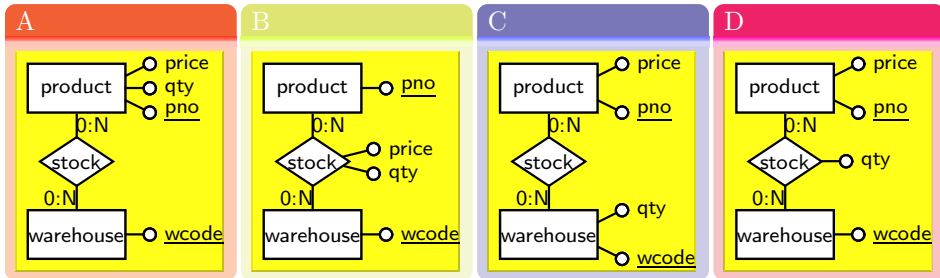

*We record the **start\_date** when a person joined a department, and when the person leaves, record the **end\_date** they left the department. We keep a history of all departments the person worked in.*

## Quiz 6: Appropriate use of attributes on relationships

*In the stock control system, we identify products by the **pno**, and keep our stock in a number of warehouses identified by **wcode**. We record single **price** of each product, and the quantity **qty** of product we keep in each warehouse.*

Which of the following best models the above domain?

## $\mathcal{ER}^N$ : Allowing nested relationships

### Identifying a nested relationship

*When a person works in a department, they may work on any number of projects with a certain role. People may take different roles on the project for each department that they work in.*

# Nested relationship equivalences

## Need for using nested relationships

If a relationship to which a nested edge connects is mandatory and unique with entity  $E$ , then the nested relationship can instead connect to  $E$

## Equivalent ER Schemas

# Quiz 7: Nested relationship equivalences

Are the two ER schemas equivalent?

True

False

# $\mathcal{ER}^\vee$ : Multi-valued Attributes

## Multi-valued Attributes

■ A mandatory attribute  $E.A$  is a function that maps from entity set  $E$  to value set  $V$ .

1  $E.A \subseteq \{\langle e, v \rangle \mid e \in E \wedge v \in V\}$

2 unique:  $\langle e, v_1 \rangle \in E.A \wedge \langle e, v_2 \rangle \in E.A \rightarrow v_1 = v_2$

3 mandatory:  $E = \{e \mid \langle e, v \rangle \in E.A\}$

**adjective, adjective noun**  $\rightarrow$  attribute

⊖ an **optional attribute** removes property (3) ?

∪ a **multi-valued attribute** removes property (2) +

■ an attribute can be both optional and multi-valued \*

## Identifying multi-valued attributes

*Each person must have at least one home phone number recorded, and may have any number of cars registered as having access to the car park.*

# EER Modelling Constructs $ADHKLMNOSVW$

## EER

Define **Extended ER (EER)** modelling language as one that supports  $KLMOS$  plus at least one of  $ADHNVW$

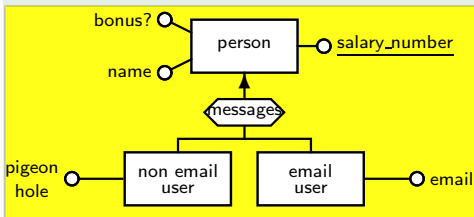

Construct	Description
$A$	Attributes can be placed on relationships
$D$	Disjointness between sub-classes can be denoted
$C$	Look-across cardinality constraints
$H$	hyper-edges ( $n$ -ary relationships) allowed
$L$	Look-here cardinality constraints
$K$	Key attributes
$M$	Mandatory attributes
$N$	Nested relationships
$O$	Optional attributes
$S$	Isa hierarchy between entities
$V$	Multi-valued attributes
$W$	Weak entities can be identified

# Mapping $\mathcal{ER}^D$ to a relational model

Taking a **table per type (TPT)** approach, if  $E$  is a generalisation of  $E_1, \dots, E_n$ , then entities  $E_1, \dots, E_n, E$  map to tables  $R_1, \dots, R_n, R$  as before and:

- 1 treat each  $E_x \in E_1, \dots, E_n$  as a subset of  $E$
- 2 no implementation of disjointness using just PKs and FKs

## Tables generated from generalisations

```

person(salary_number, name, bonus?)
non_email_user(salary_number, pigeon_hole)
non_email_user(salary_number)  $\xRightarrow{fk}$ 
    person(salary_number)
email_user(salary_number, email)
email_user(salary_number)  $\xRightarrow{fk}$ 
    person(salary_number)
  
```

# Mapping $\mathcal{ER}^W$ to a relational model

- If  $E_W$  is a weak entity that maps to a relation  $R_W$ , the foreign key  $R_K$  due to the participation in a relationship is also used in the key of  $R_K$

## Tables generated from weak entities

person(salary\_number, name, bonus?)

swipe\_card(salary\_number, issue, date)

swipe\_card(salary\_number)  $\xrightarrow{fk}$  person(salary\_number)

# Mapping $\mathcal{ER}^W$ to a relational model

- If  $E_W$  is a weak entity that maps to a relation  $R_W$ , the foreign key  $R_K$  due to the participation in a relationship is also used in the key of  $R_K$

## Tables generated from weak entities

person(salary\_number,name,bonus?)

swipe\_card(salary\_number,issue,date)

swipe\_card(salary\_number)  $\xrightarrow{fk}$  person(salary\_number)

# Mapping $\mathcal{ER}^H$ to a relational model

Rules for binary relationship  $R$  between  $E_1, E_2$  generalise to rules for  $R$  between  $E_1, \dots, E_n$

## Tables generated from $n$ -ary entities

person(salary\_number)

manager(salary\_number)

manager(salary\_number)  $\xRightarrow{f^k}$  person(salary\_number)

department(dname)

works\_in(person\_salary\_number, manager\_salary\_number, dname)

works\_in(person\_salary\_number)  $\xRightarrow{f^k}$  person(salary\_number)

works\_in(manager\_salary\_number)  $\xRightarrow{f^k}$  manager(salary\_number)

works\_in(dname)  $\xRightarrow{f^k}$  department(dname)

# Mapping $\mathcal{ER}^A$ to a relational model

## Attributes on Relationships

Attributes of a relationship go on the same table as that which implements the relationship

## Tables generated from attributes of relationships

person(salary\_number)

department(dname)

works\_in(salary\_number, dname, start\_date, end\_date?)

works\_in(salary\_number)  $\xrightarrow{f^k}$  person(salary\_number)

works\_in(dname)  $\xrightarrow{f^k}$  department(dname)

# Mapping $\mathcal{ER}^A$ to a relational model

## Attributes on Relationships

Attributes of a relationship go on the same table as that which implements the relationship

## Tables generated from attributes of relationships

person(salary\_number, dname, start\_date, end\_date?)

department(dname)

person(dname)  $\xrightarrow{f^k}$  department(dname)

Quiz 8: Handling of  $\mathcal{ER}^A$  0:1 cardinality

Which is the most precise mapping of the ER schema?

A

person(salary\_number)  
 department(dname)  
 works\_in(salary\_number, dname, start\_date, end\_date?)  
 $\text{works\_in}(\text{salary\_number}) \xRightarrow{f^k} \text{person}(\text{salary\_number})$   
 $\text{works\_in}(\text{dname}) \xRightarrow{f^k} \text{department}(\text{dname})$

B

person(salary\_number)  
 department(dname)  
 works\_in(salary\_number, dname, start\_date, end\_date?)  
 $\text{works\_in}(\text{salary\_number}) \xRightarrow{f^k} \text{person}(\text{salary\_number})$   
 $\text{works\_in}(\text{dname}) \xRightarrow{f^k} \text{department}(\text{dname})$

C

person(salary\_number, dname, start\_date, end\_date?)  
 department(dname)  
 $\text{person}(\text{dname}) \xRightarrow{f^k} \text{department}(\text{dname})$

D

person(salary\_number, dname)  
 department(dname, salary\_number, start\_date, end\_date?)  
 $\text{department}(\text{salary\_number}) \xRightarrow{f^k} \text{person}(\text{salary\_number})$

# Mapping $\mathcal{ER}^N$ to a relational model

## Nested Relationships

If relationship  $R$  connects to relationship  $S$ , (1) map  $S$  as normal, (2) when mapping  $R$ , treat  $S$  as if it were an entity, and apply the normal rules for mapping  $R$ .

## Mapping Nested Relationships

person(salary\_number)  
 department(dname)  
 project(pcode)  
 works\_in(salary\_number, dname)  
 $\text{works\_in}(\text{salary\_number}) \xRightarrow{f^k} \text{person}(\text{salary\_number})$   
 $\text{works\_in}(\text{dname}) \xRightarrow{f^k} \text{department}(\text{dname})$

member(pcode, salary\_number, dname, role)  
 $\text{member}(\text{salary\_number}, \text{dname}) \xRightarrow{f^k} \text{works\_in}(\text{salary\_number}, \text{dname})$   
 $\text{member}(\text{pcode}) \xRightarrow{f^k} \text{project}(\text{pcode})$

# Mapping $\mathcal{ER}^N$ to a relational model

## Nested Relationships

If relationship  $R$  connects to relationship  $S$ , (1) map  $S$  as normal, (2) when mapping  $R$ , treat  $S$  as if it were an entity, and apply the normal rules for mapping  $R$ .

## Mapping Nested Relationships

```

person(salary_number)
department(dname)
project(pcode)
works_in(salary_number, dname, pcode, role)
works_in(salary_number)  $\xRightarrow{fk}$  person(salary_number)
works_in(dname)  $\xRightarrow{fk}$  department(dname)
works_in(pcode)  $\xRightarrow{fk}$  project(pcode)
    
```

# Mapping $\mathcal{ER}^v$ to a relational model

## Multi-valued Attributes

Each multi-valued attribute  $E.A_v$  is stored in its own table  $RA_v$ , together with the key attributes of the table  $R$  used to represent the entity  $R$ .

All attributes of  $RA_v$  form the key of  $RA_v$ , and there is a foreign key from  $RA_v$  to  $R$

No efficient method of representing + constraint

## Tables for multi-valued attributes

person(salary\_number)

person\_phone(salary\_number, phone)

person\_phone(salary\_number)  $\xRightarrow{fk}$  person(salary\_number)

person\_car(salary\_number, car)

person\_car(salary\_number)  $\xRightarrow{fk}$  person(salary\_number)

Mapping Relational to  $\mathcal{ER}^{ADHKLMNOSVW}$  (Assuming TPT)

- H** For each table  $R$  that has primary key  $P_R$  that contains  $n$  columns which are foreign keys for  $R_1, \dots, R_n$  ( $n \geq 2$ )  $\rightarrow$  many-many ER relationship  $R$  between the ER version of  $R_1, \dots, R_n$ . For each column  $A$  of  $R$ :
  - If column part of primary key, then already represented by many-many relationship
  - A** Otherwise, create attribute  $A$  of relationship
- V** Otherwise, if  $R$  has all columns as a key, and all but one column a foreign key, map  $R$  to an optional multi-valued attribute.
- W** Otherwise, if  $R$  has a set of columns as a key, and a proper subset of those columns as a foreign key of  $S$ , map  $R$  to a weak entity.
- E** Otherwise each table  $R \rightarrow$  ER entity. For each column  $A$  on  $R$ .
  - 1** If  $A$  is (part of) a candidate key:
    - S** if candidate key is also a foreign key  $\rightarrow$  subset
    - K** otherwise  $A \rightarrow$  ER key attribute
  - 2** If  $A$  is not (part of) a candidate key:
    - R** if  $A$  is (part of) a foreign key to  $R_f \rightarrow$  ER relationship to ER version of  $R_f$
    - O** otherwise if  $A$  is nullable  $\rightarrow$  ER optional attribute
    - M** otherwise  $A \rightarrow$  ER mandatory attribute
- D** Use additional domain knowledge to convert several subclasses of a single entity into members of a single generalisation hierarchy

# Alternatives for mapping ER to Relational Form

- Table per Type (TPT)
  - Generates a large number of tables
  - Does not implement disjointness in subclasses (unless triggers are used ...)
- Table per Concrete Class (TPC)
  - Generates fewer tables, superclass instances now spread between subclass tables.
  - Does not implement disjointness in subclasses (unless triggers are used), but implement mandatory attributes or relationships.
- Table per Hierarchy (TPH)
  - Generates even fewer tables, but with many nullable attributes
  - Implement disjointness in subclasses, but does not implement mandatory attributes or relationships (unless **CHECK** constraints are used)

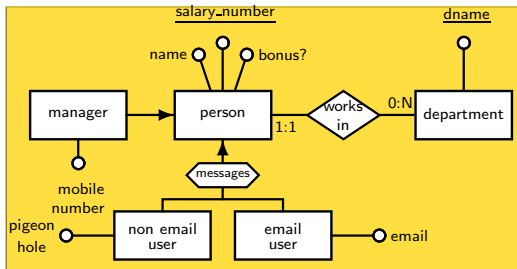

## Mapping ER to Relational Form (Explicit Inheritance)

- Each entity maps to a distinct table, except superclass entities of total generalisations, which disappear!
- Each attribute maps to a column
- Each relationship
  - that is many-many maps to a table
  - that is one-many maps to a column in the table of the 'one' end and a foreign key pointing at the many table, provided the many table has no subclasses
- Each isa and generalisation causes the attributes of superclass entity to also appear as columns of the subclass table

### Table per Concrete Type (TPC)

In ORM, this approach is called table per concrete type, since each non-virtual class type maps into a table, with the variables of super classes in the table.

# Mapping ER to Relational Form (Explicit Inheritance)

manager(salary\_number,name,bonus?,dname,mobile\_number)  
 manager(dname)  $\xRightarrow{fk}$  department(dname)  
 department(dname)  
 non\_email\_user(salary\_number,name,bonus?,dname,pigeon\_hole)  
 non\_email\_user(dname)  $\xRightarrow{fk}$  department(dname)  
 email\_user(salary\_number,name,bonus?,dname,email)  
 email\_user(dname)  $\xRightarrow{fk}$  department(dname)

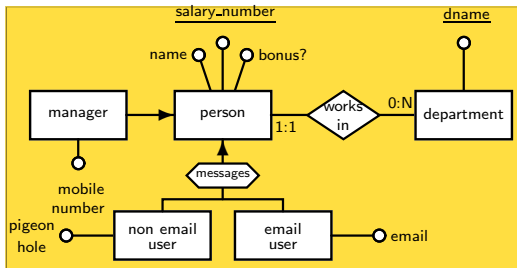

## Mapping ER to Relational Form (ISA as Attribute)

- Each non-subclass entity maps to a distinct table
- Each attribute maps to a column in the superclass table (becoming nullable if moved up from a subclass)
- Each relationship
  - that is many-many maps to a table
  - that is one-many maps to a column in the table of the 'one' end and a foreign key pointing at the many table
- Each isa maps to a boolean flag
- Each generalisation maps to an attribute taking enumerated values

### Table per Hierarchy (TPH)

In ORM, this approach is called table per hierarchy, since each class hierarchy maps into a single table

# Mapping ER to Relational Form (ISA as Attribute)

```

person(salary_number, name, bonus?, dname,
      is_manager, mobile_number?,
      messages, pigeon_hole?, email?)
person(dname)  $\xrightarrow{fk}$  department(dname)
department(dname)
  
```
